Ester Info

The general reaction for the esterification of an organic acid with an alcohol is:

Esterification reactions are a kind of elimination or condensation reactions. In this reaction, R and R' represent hydrocarbon chains, which may be the same or different. Unlike many organic chemical compounds, esters often have very pleasant fruitlike odors. Many of these odors and flavoring of fruits and flowers are due to the presence of esters in the essential oils of these materials. The table that follows lists some relatively pleasant smelling fragrances as well as indicating from what source and in which acid they ester may be prepared.

Acid	Alcohol	Ester
1 ml Butyric acid	1-methylpropan-2-ol	Isobutyl acetate
2 ml Acetic acid	1-Octanol	Orange
2 ml Butyric acid	Ethanol	Pearapple
1 ml Butyric acid	Methanol	Apple
2 ml Butyric acid	Pentanol (pentyl alcohol)	Apicot
2 ml Acrylic acid	Pentenol (pentyl alcohol)	Banana

Generally fruit or flower may only contain a few drops of ester, giving a very strong odor. Usually, the ester is part of a more complex mixture of substances which taken separately, have little or none contributed by the ester itself. When prepared in relatively large amounts, the ester may seem to have a pronounced chemical odor and it may be difficult to recognize that fruit or flower that has this aroma.

In acidic carbon represents a reaction that would come to equilibrium, with significant amounts of both reactants and products present at the point of equilibrium. Ordinarily in the synthesis of esters, one is made of the fact that most esters are highly volatile; the reaction mixture is distilled, which removes the water from the system, and which forces the equilibrium to the right so as to maximize the yield of the ester. Once the ester has been separated from the other components, however, it must be kept free of moisture to prevent the reverse of the indicated reaction from taking place.

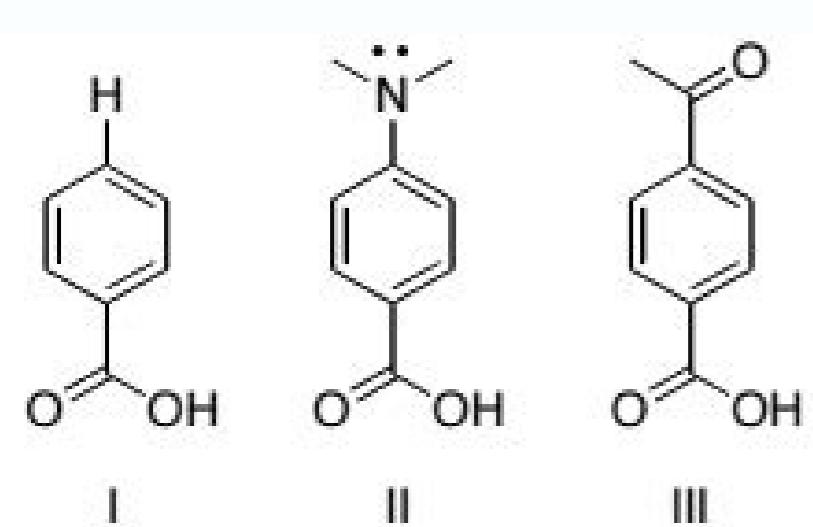

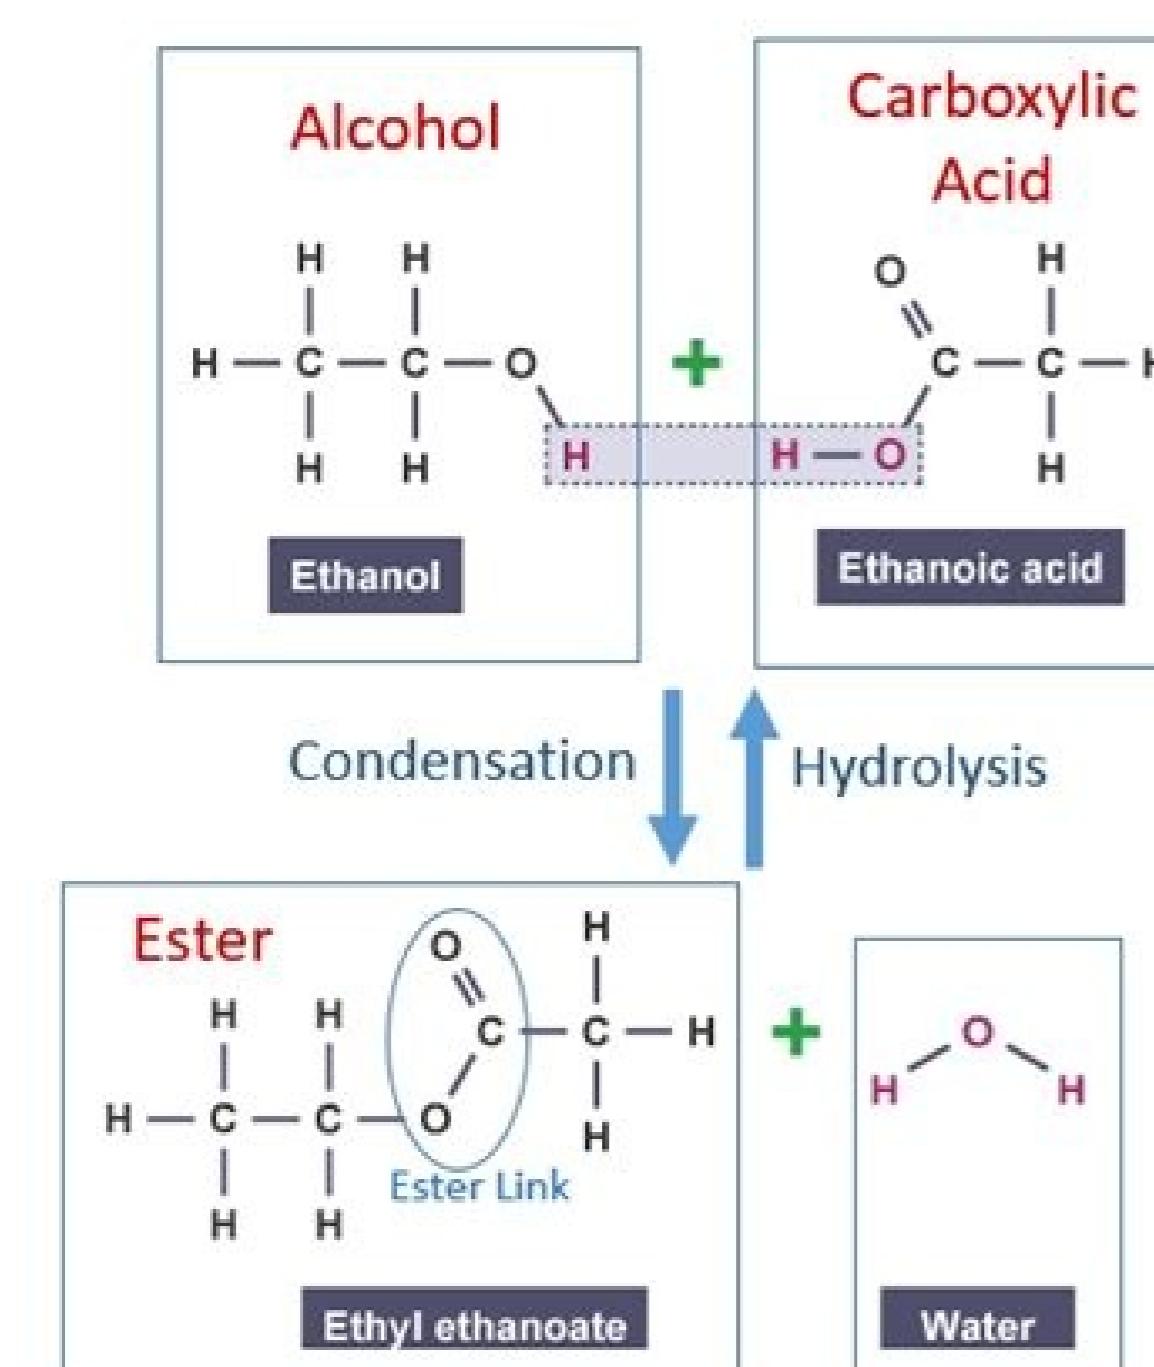

Procedures:

Caution: Be careful with the acids. Wear gloves and goggles. Use the butyric acid in the fume hood – it has a very foul odor. There is soap ash in the fume hood if you spill acid. Because the compounds aren't strong and flammable, we'll heat solution in water bath.

1. Prepare a water bath by filling a 500 ml beaker half full with water and heating it.
2. Look on the table to find the acid and an alcohol that you will combine.
3. Place 2 ml of the alcohol from the table for each ester chosen in test tube. Label the tube.
4. If the acid is a liquid, add the amount listed in ml to the alcohol in the tube. If it is a solid, add 1g of it.
5. In the fume hood, carefully add 1 ml of concentrated sulfuric acid to the tube.
6. Insert a stopper with the top removed off into the test tube to obtain a condenser. Tie tightly and then place the test tube in a boiling water bath.
7. After about 5 minutes, use tongs to remove the test tube from the water and place in a room temp water bath. Remove the condenser and check the tube for fragrance by waving a little of the vapor toward you.

Esterification

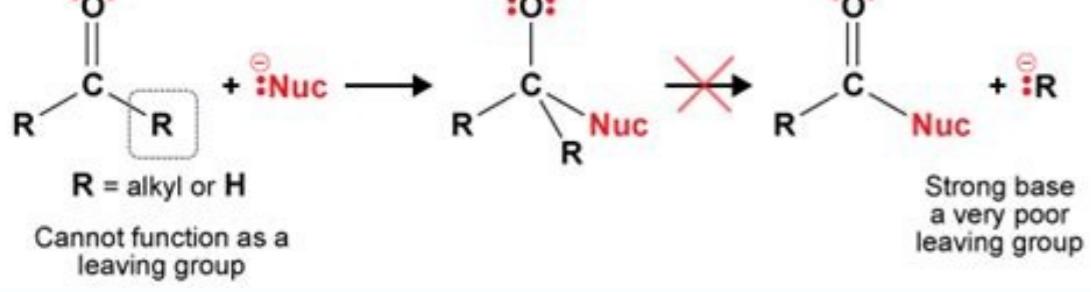

An alcohol reacts with a carboxylic acid in the presence of a catalyst (conc. H_2SO_4) to give an ester.

Can function as a leaving group

Nucleophilic addition to aldehydes and ketones

Reactions of carboxylic acids and their derivatives lab report.

However, if we were to extract with the hydroxide ion, both carboxylic acid and phenol would be converted into their conjugate bases (see Figure 2). Remember, however, that you only have two compounds in your unknown mixture so you do not isolate solids from all extracts. C. Add 5 mL of saturated aqueous NaCl and 5 mL of distilled H2O to the ethyl acetate layer in the separating funnel. Second edition. When the solution is frozen, isolate the solid precipitate by suction filtration. At the end of this sequence, you have extracted the organic solution with three portions of 10 mL 5 % aqueous sodium hydroxide. Safety Notes You must wear eye protection at all times. Remove the stopper and collect the aqueous layer in the 125 mL Erlenmeyer labeled "hydroxide". Note that in both cases the reactions favor the formation of products. Thus, the extraction of a mixture of these two compounds with bicarbonate results in ionization and extraction of a carboxylic acid in the presence of phenol, thus separating the two compounds from each other. Figure 3 shows this chemistry for you. Gently shake the separating funnel to allow an intimate mixture of the solutions and extraction of the mixture from the organic mixture. Do you remember which functional group that would be? (d) acidificherA both resulting aqueous solutions to cause any compound extracted to precipitate. If a solid falls, add a boiling stone and then gently heat the solution to return most of the solid to solution. Rodig, C. The reaction of a phenol, however, favors reactions since the pKa of the phenol (10 Å) greater than that of carbonic acid (6.4). The conjugate base of carboxylic acid, being an ionic species, Å soluble in Aqueous while the phenol (sinister union) would remain dissolved in the organic layer.
